6 Chapter 1 Introduction to Computers, the Internet and Visual Basic

1.9 What is a key advantage of interpreters over compilers? What is a key disadvantage?

ANS: A key advantage is that interpreters can execute high-level language programs directly (without the need for compilation). A key disadvantage is that interpreted programs execute more slowly than compiled programs.

1.10 What are operating systems?

ANS: Operating systems are software systems that make using computers more convenient for users, app developers and system administrators. They provide services that allow each app to execute safely, efficiently and concurrently (i.e., in parallel) with other apps.

1.11 Why is using cloud computing resources sometimes preferable to purchasing all the hardware you need for your own computer?

ANS: Cloud computing gives you the flexibility to increase or decrease computing resources to meet your resource needs at any given time, making it more cost effective than purchasing expensive hardware to ensure that you have enough storage and processing power at their occasional peak levels.

1.12 Categorize each of the following items as either hardware or software:

a) CPU

ANS: Hardware.

b) Compiler

ANS: Software

c) Input unit

a) An assembler translates source-language programs into machine-language programs.

ANS: True.

b) High-level languages are generally machine dependent.

ANS: False. A high-level language must be compiled into machine-dependent language before it can be executed. This allows high-level languages to be used on all computers with appropriate compilers.

c) A machine-language program requires translation before it can be run on a computer.

ANS: False. A machine-language program is native to a specific machine.

1.14 Expand each of the following acronyms:

a) W3C

ANS: World Wide Web Consortium

b) OOP

c) CLR

ANS: Common Language Runtime

d) UML

ANS: Unified Modeling Language

e) IDE

ANS: Integrated Development Environment

1.15 What are the key benefits of the .NET Framework and the CLR? What are the drawbacks?

ANS: The key benefits are portability between operating systems and interoperability between languages. As long as a CLR exists for a platform, it can run any .NET program. Programmers can concentrate on program logic instead of platform-specific details. Thus, the double compilation (code-to-MSIL, and MSIL-to-machine code) allows for platform independence: Programs can be written once and executed on any platform supporting the CLR—this is known as platform independence. Code written once could easily be used on another machine without modification, saving time and money. A second benefit of the .NET framework is language interoperability—software components written in different languages can interact (language independence). A drawback associated with these features is that .NET programs cannot be run until the .NET Framework is developed for a platform. Another is the overhead of the double compilation that is needed before a .NET-language program can be executed.

1.16 What are the advantages to using object-oriented techniques?

ANS: Programs that use object-oriented programming techniques are easier to understand, correct and modify. The key advantage with using object-oriented programming is that it tends to produce software that is more understandable, because it is better organized and has fewer maintenance requirements than software produced with earlier methodologies. OOP helps the programmer build applications faster by reusing existing software components that model items in the real world. OOP also helps programmers create new software components that can be reused on future software development projects. Building software quickly, correctly, and economically has been an elusive goal in the software industry. The modular, object-oriented design and implementation approach has been found to increase productivity while reducing development time, errors, and cost.

1.17 You are probably wearing on your wrist one of the world's most common types of objects—a watch. Discuss how each of the following terms and concepts applies to the notion of a watch: object, attributes and behaviors.

ANS: The entire watch is an object that is composed of many other objects (the moving parts, the band, the face, etc.) Watch attributes are time, color, band style, technology (digital or analog), and the like. The behaviors of the watch include setting the time and getting the time. A watch can be considered a specific type of clock (as can an alarm clock).

1.18 What was the key reason that Visual Basic was developed as a special version of the BASIC programming language?

ANS: To make it convenient to develop applications that would run on the Microsoft Windows operating system.

1.19 What is the key accomplishment of the UML?

ANS: It replaced the many different graphical modeling languages with a single (unified) language for modeling that can be used by developers regardless of the different OOAD processes they may use.

1.20 What did the chief benefit of the early Internet prove to be?

ANS: Communication by e-mail. Today, that communication is also facilitated by applications such as instant messaging and file transfer.

1.21 What is the key capability of the web?

ANS: It allows computer users to locate and view multimedia-based documents on almost any subject over the Internet.

8 Chapter 1 Introduction to Computers, the Internet and Visual Basic

1.22 What is the key vision of Microsoft's .NET initiative?

ANS: To embrace the Internet and the web in the development and use of software.

1.23 How does the .NET Framework Class Library facilitate the development of .NET apps?

ANS: First, the Framework Class Library is a large library of reusable classes that reduces development time. Programmers can build software quickly by reusing framework's classes, rather than building new classes "from scratch." Second, the Framework Class Library is shared by all of the .NET languages, which means that programmers who work in multiple languages have to learn only one class library.

1.24 Besides the obvious benefits of reuse made possible by OOP, what do many organizations report as another key benefit of OOP?

ANS: That OOP tends to produce software that is more understandable, better organized, and easier to maintain, modify and debug.

Making a Difference Exercises

1.25 (*Test Drive: Carbon Footprint Calculator*) Some scientists believe that carbon emissions, especially from the burning of fossil fuels, contribute significantly to global warming and that this can be combatted if individuals take steps to limit their use of carbon-based fuels. Organizations and individuals are increasingly concerned about their "carbon footprints." Websites such as TerraPass

www.terrapass.com/carbon-footprint-calculator/

and Carbon Footprint

www.carbonfootprint.com/calculator.aspx

provide carbon footprint calculators. Test drive these calculators to determine your carbon footprint. Exercises in later chapters will ask you to program your own carbon footprint calculator. To prepare for this, use the web to research the formulas for calculating carbon footprints.

1.26 (*Test Drive: Body Mass Index Calculator*) Obesity can cause significant increases in illnesses such as diabetes and heart disease. To determine whether a person is overweight or obese, you can use a measure called the body mass index (BMI). The United States Department of Health and Human Services provides a BMI calculator at www.nhlbhsupport.com/bmi/. Use it to calculate your own BMI. A forthcoming exercise will ask you to program your own BMI calculator. To prepare for this, use the web to research the formulas for calculating BMI.

1.27 (*Attributes of Hybrid Vehicles*) In this chapter you learned some basics of classes. Now you'll "flesh out" aspects of a class called "Hybrid Vehicle." Hybrid vehicles are becoming increasingly popular, because they often get much better mileage than purely gasoline-powered vehicles. Browse the web and study the features of four or five of today's popular hybrid cars, then list as many of their hybrid-related attributes as you can. Some common attributes include city-miles-per-gallon and highway-miles-per-gallon. Also list the attributes of the batteries (type, weight, etc.).

ANS:

- Manufacturer
- Type of Hybrid—Battery hybrid (Hybrid Electric Vehicles), Plug-in hybrid, Fuel cell etc.
- Driver feedback system—so the driver can monitor fuel efficiency based on their driving
- Energy recovery—for example, regenerative breaking
- Carbon footprint—tons of CO₂ per year
- Fuel capacity
- City-miles-per-gallon
- Highway-miles-per-gallon

- Two-mode hybrid propulsion system
- Engine size—V6, V8, etc.
- Vehicle type—SUV, crossover, compact, mid-size, etc.
- Seating capacity
- Horse power
- Drive train (front wheel drive, all wheel drive)
- Top speed
- Torque
- Price

1.28 (*Gender Neutrality*) Many people want to eliminate sexism in all forms of communication. You've been asked to create a program that can process a paragraph of text and replace gender-specific words with gender-neutral ones. Assuming that you've been given a list of gender-specific words and their gender-neutral replacements (e.g., replace both "wife" and "husband" with "spouse," both "man" and "woman" with "person," both "son" and "daughter" with "child" and so on), explain the procedure you'd use to read through a paragraph of text and manually perform these replacements. How might your procedure generate a strange term like "woperchild?" You'll soon learn that a more formal term for "procedure" is "algorithm," and that an algorithm specifies the steps to be performed and the order in which to perform them.

ANS: Search through the entire paragraph for a word such as "wife" and replace every occurrence with "spouse." Repeat this searching process for every gender specific word in the list. You could accidentally get a word like "woperchild" if you are not careful about how you perform replacements. For example, the word "man" can be part of a larger word, like "woman." So, replacing every occurrence of "man" can yield strange results. Consider the process of replacing "man" with "person" then replacing "son" with "child." If you encounter the word "woman," which contains the word "man," you'd replace "man" with "person" resulting in the word "woperson." In a subsequent pass you'd encounter "woperson" and replace "son" with "child" resulting in the "woperchild."
